DATA SCIENCE & ANALYTICS ENGINEERING

London, UK | +44 (0) 7856 773535 | nikandroyxa@gmail.com | [LinkedIn](#) | [GitHub Portfolio](#)

09/2026

Dear Hiring Manager,

Please accept this letter and accompanying CV as an application for a graduate or junior opportunity in data science or data analytics engineering. My preparation combines an MSc in Data Science & Analytics, completed with Distinction, with practical work in Python, SQL, machine learning and cloud-based data pipelines. I would bring both a developing technical foundation and the business perspective gained from working in hospitality and event analysis.

These opportunities interest me because they place programming and practical problem-solving at the centre of the work. I am seeking an entry-level position where I can contribute to a team and learn how dependable data solutions are developed within an organisation. At present, I am extending my skills through independent projects while developing hospitality software alongside part-time bar work. In my MotoGP project, I connected web scraping with Google Cloud Storage and BigQuery, creating a workflow that moves collected information into cloud storage and SQL analysis. A separate League of Legends project involved collecting match data through the Riot Games API, engineering features and comparing classification models through a train-test workflow. I have also combined the X API with Claude to extract structured sentiment and topic information from gaming discussions, incorporating rate limiting and error handling into the collection process. Together, these projects have given me practical experience of the relationship between data acquisition, preparation and downstream analysis.

Alongside this independent work, my Data Analyst Intern placement with Rakun LTD provided experience cleaning information with Python and SQL, restructuring datasets and supporting a data warehousing team. Earlier, as Business Optimisation Analyst with LEGO Education of Greece, I used participant demographics and engagement patterns to inform event decisions, with SQL supporting data preparation and reporting. That experience connected technical analysis with a practical business question: how an event could be structured more effectively. My postgraduate dissertation added a separate foundation in predictive modelling, including work with imbalanced data, feature selection and cross-validation. These experiences have helped me develop beyond learning individual tools towards understanding how different analytical stages fit together.

I can offer a combination of coding practice, analytical training and an understanding of operational priorities. My hospitality background has involved staff coordination, inventory decisions and the use of sales information, giving me context for the business processes that data work can support. In me, your team would gain a graduate who is prepared to start at the appropriate level, ask questions, respond to feedback and take responsibility for developing sound working habits. I am particularly interested in contributing to hands-on technical work while learning your team's approach to data quality, modelling and pipeline development.

Thank you for your consideration, and I look forward to the opportunity to speak with you about my candidacy in greater detail. I would welcome the chance to discuss my portfolio and explain how my technical preparation and practical working experience could support your team.

Sincerely,

Babis Nikandrou
