10/26

Dear Hiring Manager,

I would like to join a data team where I can contribute Python and SQL development, analytical work and a practical understanding of business operations. My MSc in Data Science & Analytics from the University of Westminster, completed with Distinction and a top-10% class ranking, provides the academic foundation for this move. I have continued building on that foundation through independent projects and an analyst internship, with a particular interest in graduate and junior roles involving substantial coding.

My main development focus today is an AI Hospitality Assistant intended to provide live training to staff during their shifts. I work on the software every day alongside my part-time hospitality role. Having managed bar operations and trained staff, I bring direct experience of the environment in which the assistant is intended to be used. The innovation idea and business plan won first prize at the University of Westminster, leading to university support and initial funding. This ongoing venture gives me a practical reason to keep developing my technical skills around a specific operational need.

My portfolio demonstrates the technical work I can bring to a junior position. For a MotoGP project, I linked web scraping with Google Cloud Storage and BigQuery, analysing 23 races through SQL and visualisations. A separate gaming project combined the X API with Claude Sonnet 4.5 and an automated workflow for turning LLM responses into structured sentiment and topic data. I also used 460 League of Legends matches to engineer 21 features and compare classification models, recording 94.5% accuracy and 0.986 ROC-AUC in project evaluation.

I've applied analytical methods in work settings as well. At Rakun LTD, I used Python and SQL to prepare datasets and reduce data errors and inconsistencies by approximately 10%. Earlier, my SQL analysis of more than 3,500 participants at LEGO Education of Greece helped inform event changes associated with a 12% year-over-year increase in ROI. My hospitality management experience adds an understanding of how operational decisions affect costs: at Hilton Docklands Riverside, data-informed inventory and scheduling changes reduced waste by 13% and labour costs by approximately 6%.

I would welcome the opportunity to discuss my portfolio and current software development work, and how they could contribute to your team. Thank you for considering my application.

Yours sincerely,

Babis Nikandrou
